

HighVIEW®

Enterprise Information Management Program

CACI's HighVIEW is a proven enterprise content management platform with a history of supporting information management, case processing, and media exploitation missions in the Intelligence Community, U.S. Federal Government, and state governments. HighVIEW is the go-to capability for Freedom of Information Act (FOIA), document and media exploitation (DOMEX), declassification, and process automation requirements.

A robust commercial off-the-shelf (COTS) document and workflow management toolkit, HighVIEW provides the building blocks to infinitely scale and diversify configurable systems for document, workflow, and knowledge management requirements. HighVIEW modules can be configured to meet a range of unique customer document processing requirements. Modules fit together seamlessly and are easy to modify, extend, or upgrade.

HighVIEW's history of success with large-scale, formal, tailored document redaction processing distinguishes it from other systems. It enables rapid and effective digitization and organization of scanned paper document libraries, using a desktop scanning application that adds pages directly into an adaptable, customer-defined "business object"—which represents a piece of a customer's data collection. HighVIEW also supports an application program interface (API) with commercial imaging libraries, allowing conversion between image formats and inspection of multiple image types.

HighVIEW

Features

- Image redaction and annotation
- Scanning with barcode recognition
- Object relationship modeling
- Data capture
- Data and content management
- Workflow
- Security
- Image refinement
- Packaged integration with third-party technologies for text extraction and optical character recognition (OCR)
- Packaged connectors for machine translation, named entity extraction, and language identification

Benefits

- HighVIEW's specialized workflow system optimizes complex business processes. Easy-to-use graphical interface allows design of complex workflows that transform large volumes of data into valuable knowledge.
- HighVIEW applications grow easily with the enterprise through the addition of Oracle® Database server instances to accommodate data scalability, processing, and user load.
- HighVIEW can be easily updated as requirements evolve. New data types and attributes can be introduced, and interfaces can be reconfigured rapidly without programming. Workflow processes can be altered as requirements change, reducing maintenance costs.

Search, Redaction, and Discovery Tools

HighVIEW's search, redaction, and discovery tools set it apart from similar systems. The search function of HighVIEW is a marquee feature, combining relational search and full text content search across its many business objects in a user-friendly arrangement. HighVIEW search allows users to query business objects by property, relationship to object, geographic search, or full text content search. It also supports saved searches, so users can execute the same search over time and monitor data as it changes – even attaching these searches to query agents that send email to users when results change.

HighVIEW's redaction capabilities contain an image-based redaction application, plus the infrastructure to support it. This includes workflow-based activities to perform redaction preparation, creating draft documents and sealed documents, automatic blacklist redaction, and automatic PII (personally identifiable information) redaction.

HighVIEW's newest capability, the discovery framework, allows application developers to create components that identify passages of interest in text-based documents. This capability can drive features such as machine learning classification, deriving features from documents, identifying sensitive information like PII, or any other document-level analysis application developers need to incorporate into a system. This capability is also available as an application-level component (Discovery AutoPII) that uses discovery within a HighVIEW system to find and redact PII.

Scanning, Imaging, and Third Party Integration

HighVIEW provides a platform for digitizing and organizing libraries of scanned paper documents, and maintains support for these features with a desktop scanning application. HighVIEW's imaging component supports an API with commercial imaging libraries, allowing conversion between formats and inspection of multiple image types.

HighVIEW was built as an integration platform, making a variety of content-centric tools available to application developers to use in building custom enterprise content management solutions. It also bundles third party libraries such as PixTools® for scanning support, and the Amazon Web Services® software development kit (AWS SDK) for integration with AWS Simple Storage Service (S3). All of these capabilities are included in the core HighVIEW platform.

EXPERTISE and TECHNOLOGY
for National Security

At CACI International Inc (NYSE: CACI), our 25,000 talented and dynamic employees are ever vigilant in delivering distinctive expertise and differentiated technology to meet our customers' greatest challenges in national security. We are a company of good character, relentless innovation, and long-standing excellence. Our culture drives our success and earns us recognition as a *Fortune* World's Most Admired Company. CACI is a member of the *Fortune* 1000 Largest Companies, the Russell 1000 Index, and the S&P MidCap 400 Index. For more information, visit us at www.caci.com.
